

Ring sizer print check

ISO 8653:2016 defines the ring-size as the inner circumference in millimetres. A size 54 is 54 mm around the inside.

Borrow a ring they already wear on the same finger. A jeweler measures that ring. Do not guess from a photo.

A paper strip or string around the finger is a rough check. It stretches, and the finger is larger at the end of the day. Mark the overlap, measure the strip in millimetres, and treat the number as a guess.

The printable bar is 50 mm long. Print at 100% scale. If the bar is not 50 mm on paper, the print is wrong and the page cannot size a ring.

Screen circles are not used here. A display is not a reliable millimetre.

Confirm the size with a jeweler before anyone buys a ring. This page does not rank a brand and does not quote a price.

The bar on this page is 141.73 points, which is 50 mm. Measure it with a ruler. If it is not 50 mm, reprint at 100 percent scale.

ISO 8653:2016 sizes are the inner circumference in millimetres. The sample of that standard lists diameters 13.05 mm (size 41), 16.23 mm (size 51), 19.42 mm (size 61), 22.60 mm (size 71), and 24.19 mm (size 76).
